

# Cognitive Media Processing #12

---

**Nobuaki Minematsu**

# Menu of the last four lectures

## **Robust processing of easily changeable stimuli**

- Robust processing of general sensory stimuli
- Any difference in the processing between humans and animals?

## **Human development of spoken language**

- Infants' vocal imitation of their parents' utterances
- What acoustic aspect of the parents' voices do they imitate?

## **Speaker-invariant holistic pattern in an utterance**

- Completely transform-invariant features --  $f$ -divergence --
- Implementation of word Gestalt as relative timbre perception
- Application of speech structure to robust speech processing

## **Radical but interesting discussion**

- A hypothesis on the origin and emergence of language
- What is the definition of "human-like" robots?

# A difference bet. machines and humans

## Machine strategy (engineers' strategy): ASR

- Collecting a huge amount of speaker-**balanced** data
  - Statistical training of acoustic models of individual phonemes (allophones)
- Adaptation of the models to new environments and speakers
  - Acoustic mismatch** bet. training and testing conditions must be reduced.

## Human strategy: HSR

- A major part of the utterances an infant hears are from its parents.
  - The utterances one can hear are extremely speaker-**biased**.
- Infants don't care about the mismatch in lang. acquisition.
  - Their vocal imitation is not acoustic, it is not impersonation!!

# Feature separation to find specific info.

De facto standard acoustic analysis of s

**Insensitivity** to pitch differences

**Insensitivity** to phase differences

## Two acoustic models for speech/speaker recognition

- Speaker-independent acoustic model for **w**ord recognition

$$P(o|w) = \sum_s P(o, s|w) = \sum_s P(o|w, s)P(s|w) \sim \sum_s \underline{P(o|w, s)}P(s)$$

- Text-independent acoustic model for **s**peaker recognition

$$P(o|s) = \sum_w P(o, w|s) = \sum_w P(o|w, s)P(w|s) \sim \sum_w \underline{P(o|w, s)}P(w)$$

- Require **intensive collection**

$$o \rightarrow o_w + o_s \text{ is possible or not?}$$

# Insensitivity and sensitivity

## Infants' vocal learning is

- insensitive to age and gender differences. (A)
- sensitive to accent differences. (B)

## Infants' vocal learning seems to be

- insensitive to feature **instances** and sensitive to feature **relations**.
  - (A) = instances and (B) = relations.
- Relations, i.e., shape of distribution can be represented geometrically as **distance matrix**.

formant frequencies of adults and children

## (B) Williamsport, PA

## Chicago, IL

## Ann Arbor, MI

## Rochester, NY

Distribution of normalized formants among AE dialects [Labov et al.'05]

# “Separately brought up identical twins”

The parents get divorced immediately after the birth.

- The twins were brought up separately by the parents.
- What kind of pron. will the twins have acquired 5 years later?

Diff. of VTL = Diff. of timbre

Diff. of regional accents = Diff. of timbre

Machines that don't learn  
what infants don't learn.

# Invariance in variability

## Topological invariance [Minematsu'09]

- Topology focuses on invariant features wrt. any kind of deformation.

# Complete transform-invariance

## Any general expression for invariance?[Qiao'10]

- BD is just one example of invariant contrasts.
- f-divergence is invariant with any kind of transformation.

- $$f_{div}(p_1, p_2) = \int p_2(\mathbf{x}) g\left(\frac{p_1(\mathbf{x})}{p_2(\mathbf{x})}\right) d\mathbf{x}$$

- $$g(t) = t \log(t) \rightarrow f_{div} = \text{KL} - \text{div.} \quad g(t) = \sqrt{t} \rightarrow -\log(f_{div}) = \text{BD}$$

- $$f_{div}(p_1, p_2) = f_{div}(P_1, P_2)$$

- Invariant features have to be f-divergence.

- If  $\oint M(p_1(\mathbf{x}), p_2(\mathbf{x})) d\mathbf{x}$  is invariant with any transformation,

- The following condition has to be satisfied.  $M = p_2(\mathbf{x}) g\left(\frac{p_1(\mathbf{x})}{p_2(\mathbf{x})}\right)$

# Invariant speech structure

Utterance to structure conversion using  $f$ -div. [Minematsu'06]

spectrogram (spectrum slice sequence)

cepstrum vector sequence

distribution\_sequence

An event (distribution) has to be much smaller than a phoneme.

# Application of structures to ASR

## Isolated word recognition using warped utterances

- Word =  $V_1V_2V_3V_4V_5$  such as /eoau/, PP = 120 (CL=0.8%)
- Word-based HMMs (20 states) vs. word-based structures (20 events)
  - Training = 4M+4F adults, testing = other 4M+4F with various VTLs
- 4,130-speaker triphone HMMs are also tested with 0.30.
- The speaker-independent HMMs widely used as baseline model in Japan

# An experiment with real vocal imitation

## Demonstration with my wife and daughter

- Constraint conditions are given by my wife.
- Initial conditions are given by my daughter.

# A big solution for CALL development

Proficiency estimation based on **structural distance**

(Minematsu@ICSLP 2004)

# Contrast-based comparison

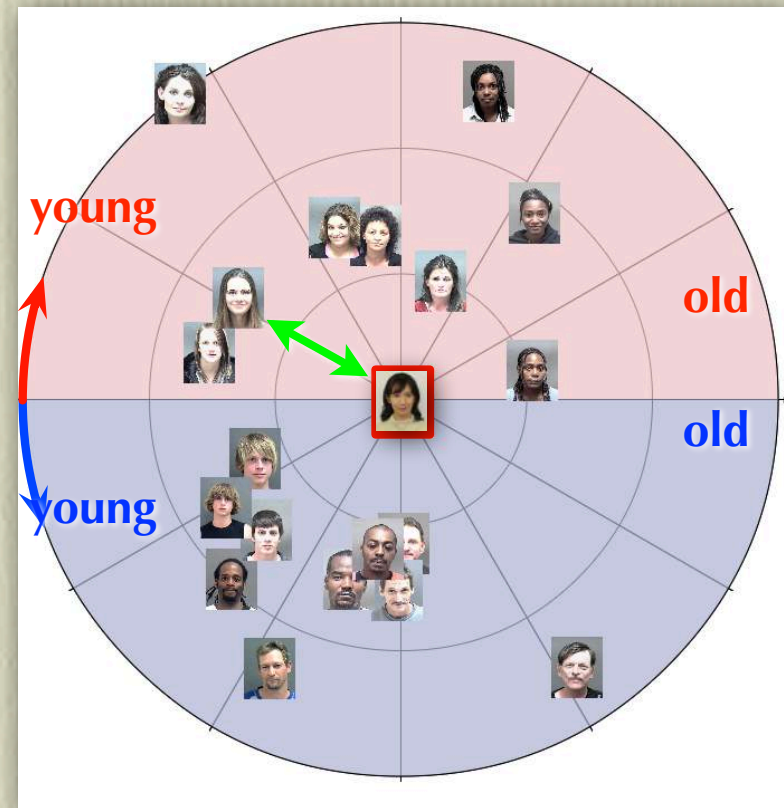

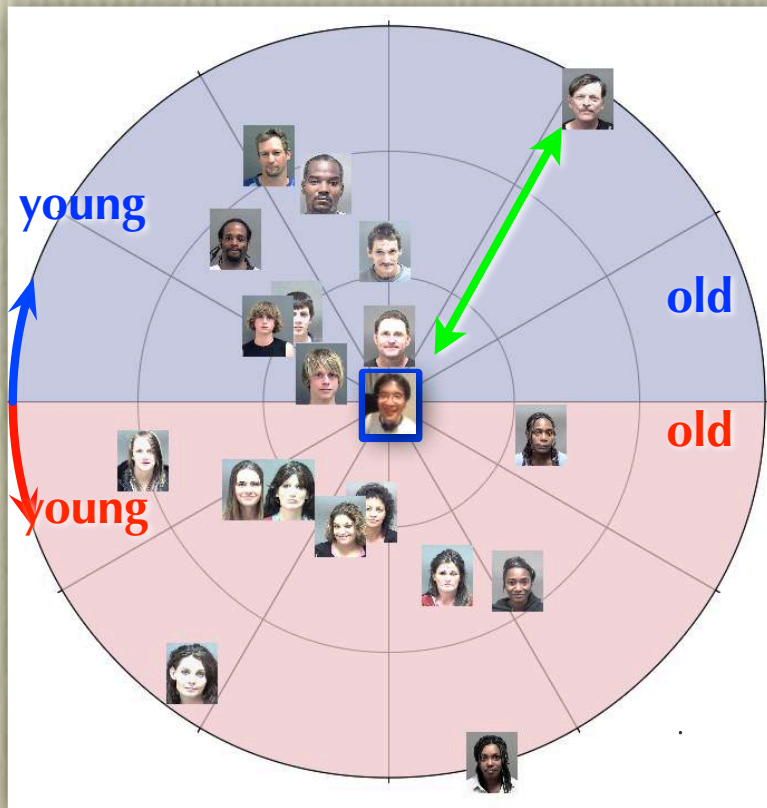

# Application of **speaker-pair-open** prediction

## TED talks browser from your viewpoint

- If TED talkers provide their SAA readings....
- If these readings are transcribed by phoneticians....

## Visualization of pronunciation diversity [Kawase *et al.*, '14]

Y. Kawase, et al., “Visualization of pronunciation diversity of World Englishes from a speaker’s self-centered viewpoint”

# DNN and speech structure

## Deep neural network [Hinton+'06, '12]

- Deeply stacked artificial neural networks
- Results in a huge number of weights
- Unsupervised pre-training and supervised fine-tuning

## Findings in DNN-based ASR [Mohamed+'12]

- First several layers seem to work as extractor of invariant features or speaker-normalized features.
- Still difficult to interpret structure and weights of DNN physically.
  - Interpretable DNNs are becoming one of the hot topics [Sim'15].

## A simple question asked in tutorial talks of DNN

- “What are *really* speaker-independent features?”
  - Asked by N. Morgan at APSIPA2013 and ASRU2013

## Some similarities between DNN and speech structure?

# DNN as posterior estimator

## General framework for training DNN

- Unsupervised pre-training and supervised training
  - In the latter training, speaker-adapted HMMs are used to prepare posteriors (=labels) for each frame of the training data.
- DNN is trained so that it can extract speaker-invariant features and can predict posteriors in a speaker-independent way.
- Output of DNN = posteriors (phoneme state posteriors in ASR)

# Posteriors = normalized similarities

## Posteriors of $\{P(c_i|o)\}$

- $P(c_i|o) \propto P(o|c_i)P(c_i)$
- $\sum_i P(c_i|o) = 1.0$
- Can be interpreted as normalized similarity scores biased by priors.
- Output of DNN = normalized similarity scores to a definite set of **speaker-adapted** acoustic “anchors” of  $\{c_i\}$ .

■ : speaker-dependent      ■ : speaker-independent(invariant)

- Similarities can be converted to **distances/contrasts to “anchors”**.
- Either of similarity matrix or distance matrix is used for clustering.

# Distances to anchors

## Speech structure extracted from an utterance

spectrogram (spectrum slice sequence)

cepstrum vector sequence

distribution sequence

## Structure extraction for speakers ■ and ■

■ ■ : speaker-dependent

■ : speaker-independent(invariant)

# Invariant contrasts

## **DNN as speaker-invariant contrast estimation**

- Use of spk-dependent HMMs to prepare posterior labels
  - “Anchors” have to be given from researchers.
- A huge amount of data to guarantee spk-invariance of DNN

## **Str. extraction as speaker-invariant contrast detection**

- Use of within-utterance acoustic events only
  - “Anchors” exist in a given utterance.
- Spk-invariance is guaranteed by invariant properties of f-div.

# A claim found in classical linguistics

## Theory of relational invariance [Jakobson+'79]

- Also known as theory of distinctive features
- Proposed by R. Jakobson

We have to put aside the accidental properties of individual sounds and substitute a general expression that is the common denominator of these variables.

Physiologically identical sounds may possess different values in conformity with the whole sound system, i.e. in their relations to the other sounds.

# More classical claims in linguistics

## Nikolay Sergeevich Trubetskoy (1890-1938)

- “The Principles of Phonology” (1939)
- The phonemes should not be considered as building blocks out of which individual words are assembled. Each word is a phonic entity, a Gestalt, and is also recognized as such by the hearer.
- As a Gestalt, each word contains something more than sum of its constituents (phonemes), namely, the principle of unity holds the phoneme sequence together and lends individuality to a word.

# More classical claims in linguistics

## Ferdinand de Saussure (1857-1913)

- Father of modern linguistics
- “Course in General Linguistics” (1916)
- What defines a linguistic element, conceptual or phonic, is the relation in which it stands to the other elements in the linguistic system.
- The important thing in the word is not the sound alone but the phonic differences that make it possible to distinguish this word from the others.
- Language is a system of only conceptual differences and phonic differences.

$$\begin{bmatrix} d_{11} & d_{12} & \dots & d_{1N} \\ d_{21} & d_{22} & \dots & d_{2N} \\ d_{31} & & & \\ \vdots & & & \\ d_{N1} & d_{N2} & \dots & d_{NN} \end{bmatrix}$$

# Poverty of Stimulus

<https://www.thoughtco.com/poverty-of-the-stimulus-pos-1691521>

It is the argument that the linguistic input received by young children is in itself insufficient to explain their detailed knowledge of their first language, so people must be born with an innate ability to learn a language.

# Menu of the last four lectures

## **Robust processing of easily changeable stimuli**

## A MODULATION-DEMODULATION MODEL FOR SPEECH COMMUNICATION AND ITS EMERGENCE

NOBUAKI MINEMATSU

*Graduate School of Info. Sci. and Tech., The University of Tokyo, Japan,  
mine@gavo.t.u-tokyo.ac.jp*

Perceptual invariance against large acoustic variability in speech has been a long-discussed question in speech science and engineering (Perkell & Klatt, 2002), and it is still an open question (Newman, 2008; Furui, 2009). Recently, we proposed a candidate answer based on mathematically-guaranteed relational invariance (Minematsu et al., 2010; Qiao & Minematsu, 2010). Here, transform-invariant features,  $f$ -divergences, are extracted from the speech dynamics in an utterance to form an invariant topological shape which characterizes and represents the linguistic message conveyed in that utterance. In this paper, this representation is interpreted from a viewpoint of telecommunications, linguistics, and evolutionary anthropology. Speech production is often regarded as a process of modulating the baseline timbre of a speaker's voice by manipulating the vocal organs, i.e., spectrum modulation. Then, extraction of the linguistic message from an utterance can be viewed as a process of spectrum *demodulation*. This modulation-demodulation model of speech communication has a strong link to known morphological and cognitive differences between humans and apes.

# Modulation used in telecommunication

## From Wikipedia

*A musician modulates the tone from a musical instrument by varying its volume, timing and pitch. The three key parameters of a carrier sine wave are its amplitude (“volume”), its phase (“timing”) and its frequency (“pitch”), all of which can be modified in accordance with a content signal to obtain the modulated carrier.*

# A way of characterizing speech production

## Speech production as spectrum modulation

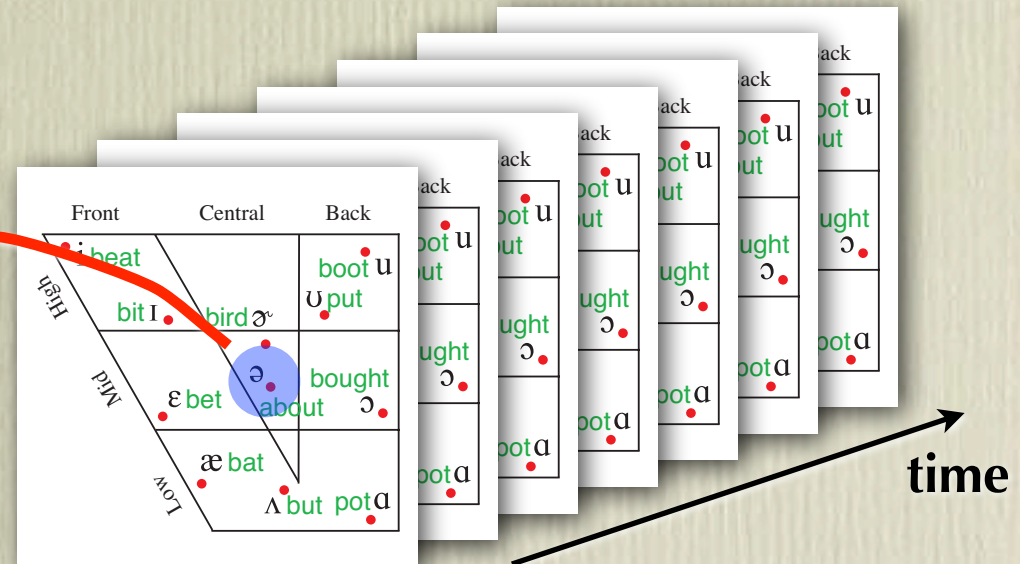

- Modulation in frequency (FM), amplitude (AM), and phase (PM)
  - = Modulation in pitch, volume, and timing (from Wikipedia)
  - = Pitch contour, intensity contour, and rhythm (= prosodic features)
- What about a fourth parameter, which is **spectrum (timbre)**?
  - = Modulation in spectrum (timbre) [Scott'07]
  - = **Another prosodic feature?**

**Tongue =  
modulator**

**Schwa**

**= most lax**  
**= most frequent**  
**= home position**  
**= spk.-specific  
baseline timbre**

# Demodulation used in telecommunication

## Demodulation in frequency, amplitude, and phase

- Demodulation = a process of extracting a message intactly by removing the carrier component from the modulated carrier signal.
- Not by extensive collection of samples of modulated carriers
- (Not by hiding the carrier component by extensive collection)

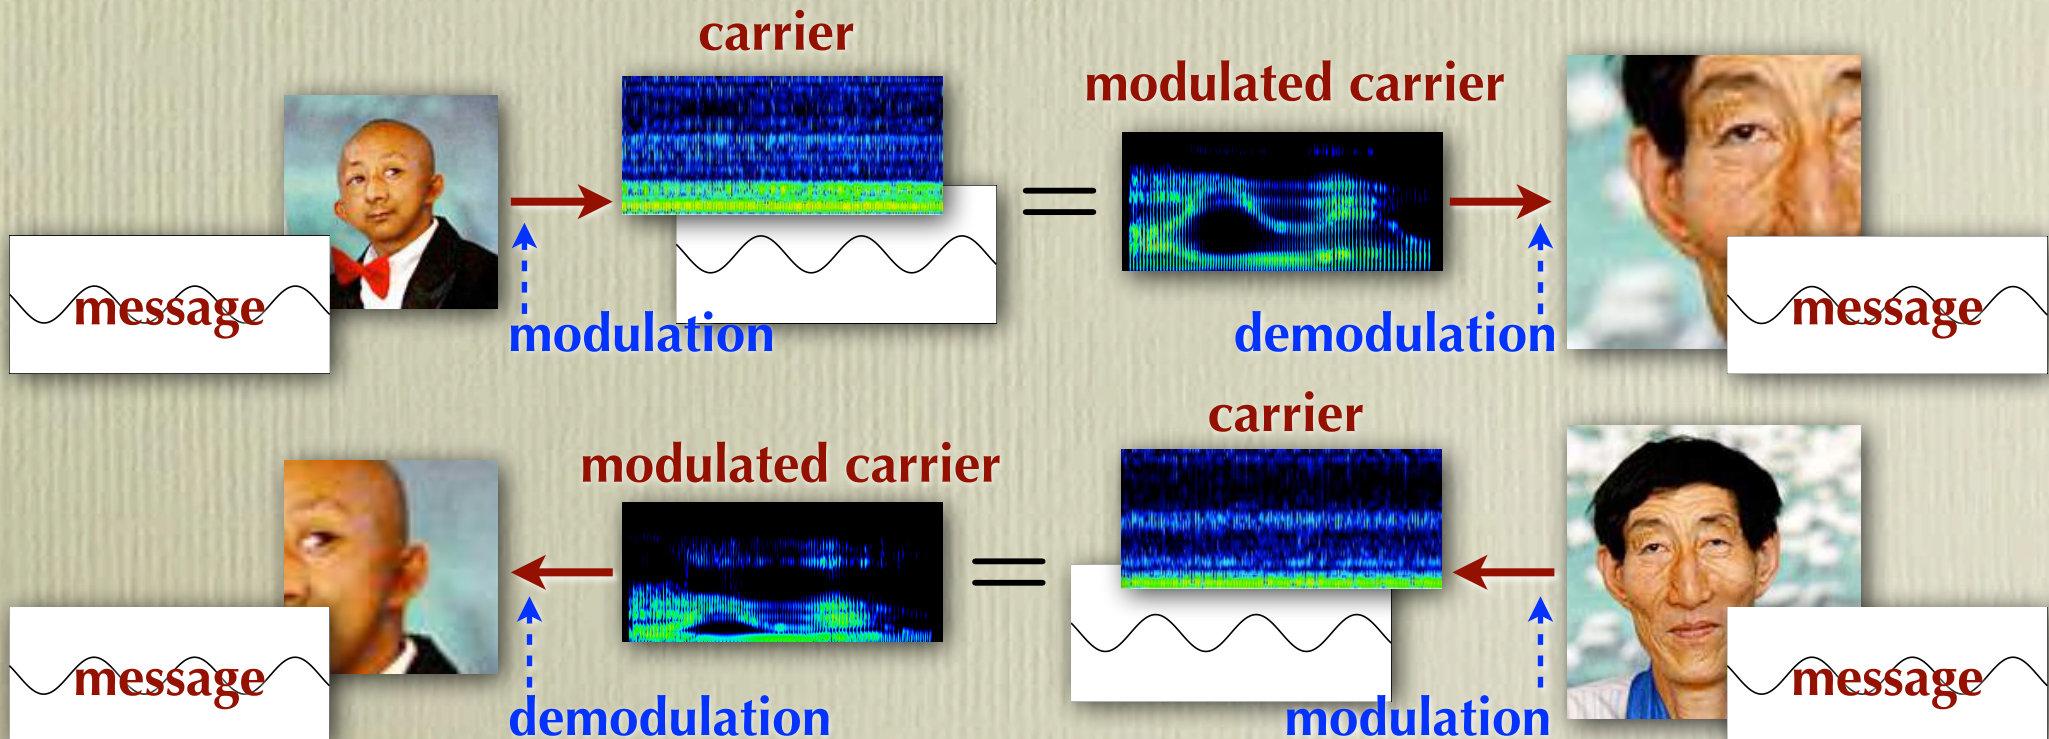

# Spectrum demodulation

## Speech recognition = spectrum (timbre) demodulation

- Demodulation = a process of extracting a message intactly by removing the carrier component from the modulated carrier signal.
- By removing speaker-specific baseline spectrum characteristics
- Not by extensive collection of samples of modulated carriers
- (Not by hiding the carrier component by extensive collection)

# Invariant speech structure

Utterance to structure conversion using  $f$ -div. [Minematsu'06]

spectrogram (spectrum slice sequence)

cepstrum vector sequence

distribution sequence

● An event (distribution) has to be much smaller than a phoneme.

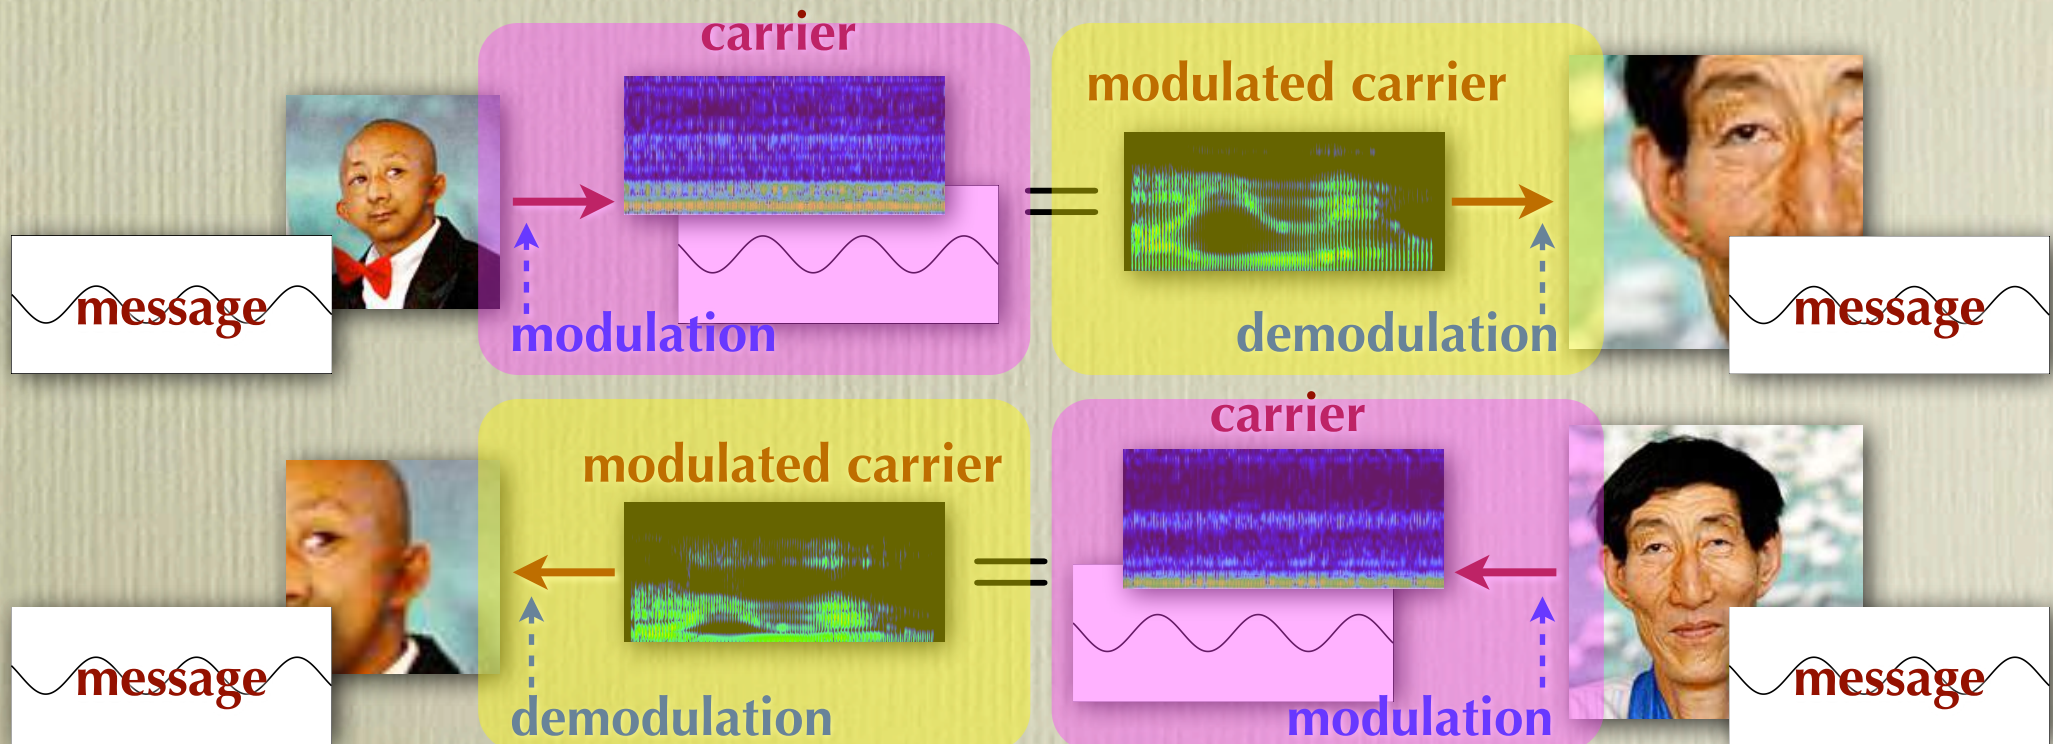

# Two questions

## Q1: Does an ape have a good modulator?

Does the tongue of an ape work as a good modulator?

## Q2: Does an ape have a good demodulator?

Does the ear (brain) of an ape extract the message intactly?

# Structural diff. in the mouth and the nose

フィレンツォ・ファッキーニ著「人類の起源」同朋社出版 P114～115の図を改変

チンパンジー

喉頭蓋は軟口蓋とほんの少しだけ離れてい

喉頭が下がっているため、喉頭蓋が声帯でつくられた音が共鳴する。ヒトが発する声音の大部分は喉頭蓋が軟口蓋と離れていることでつくられる。

# Flexibility of tongue motion

**The chimp's tongue is much stiffer than the human's.**

- “Morphological analyses and 3D modeling of the tongue musculature of the chimpanzee” (Takemoto'08)
- Less capability of manipulating the shape of the tongue.

# Old and new “Planet of the Apes”

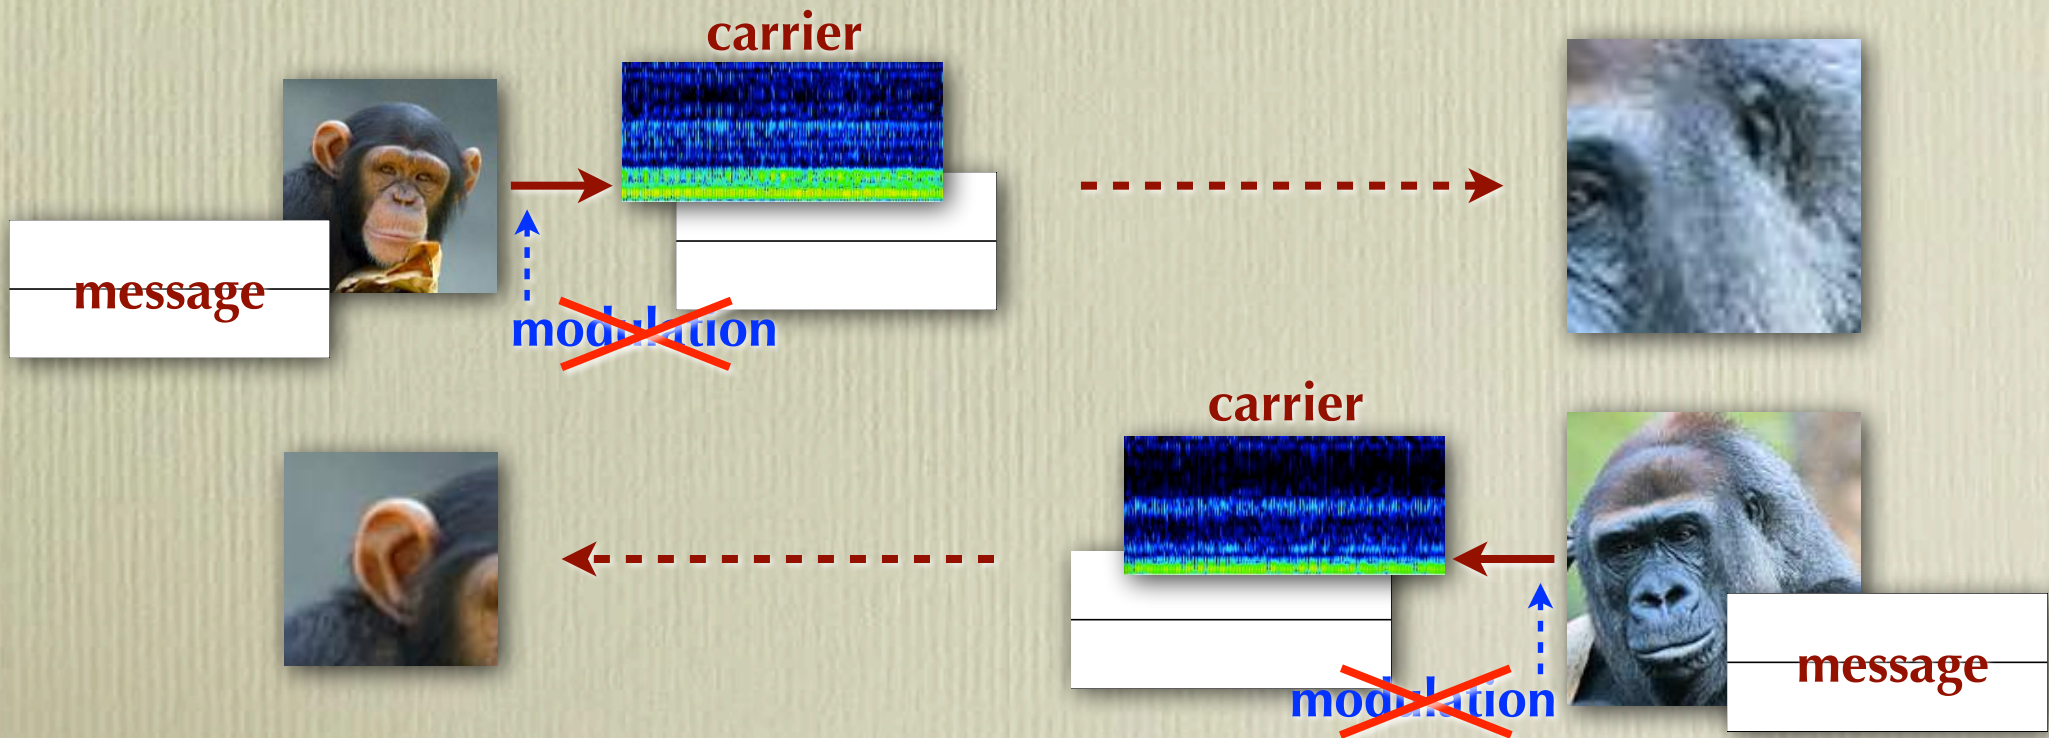

# Q1: Does the ape have a good modulator?

## Morphological characteristics of the ape's tongue

- Two (almost) independent tracts [Hayama'99]
  - One is from the nose to the lung for breathing.
  - The other is from the mouth to the stomach for eating.
- Much lower ability of deforming the tongue shape [Takemoto'08]
  - The chimp's tongue is stiffer than the human's.

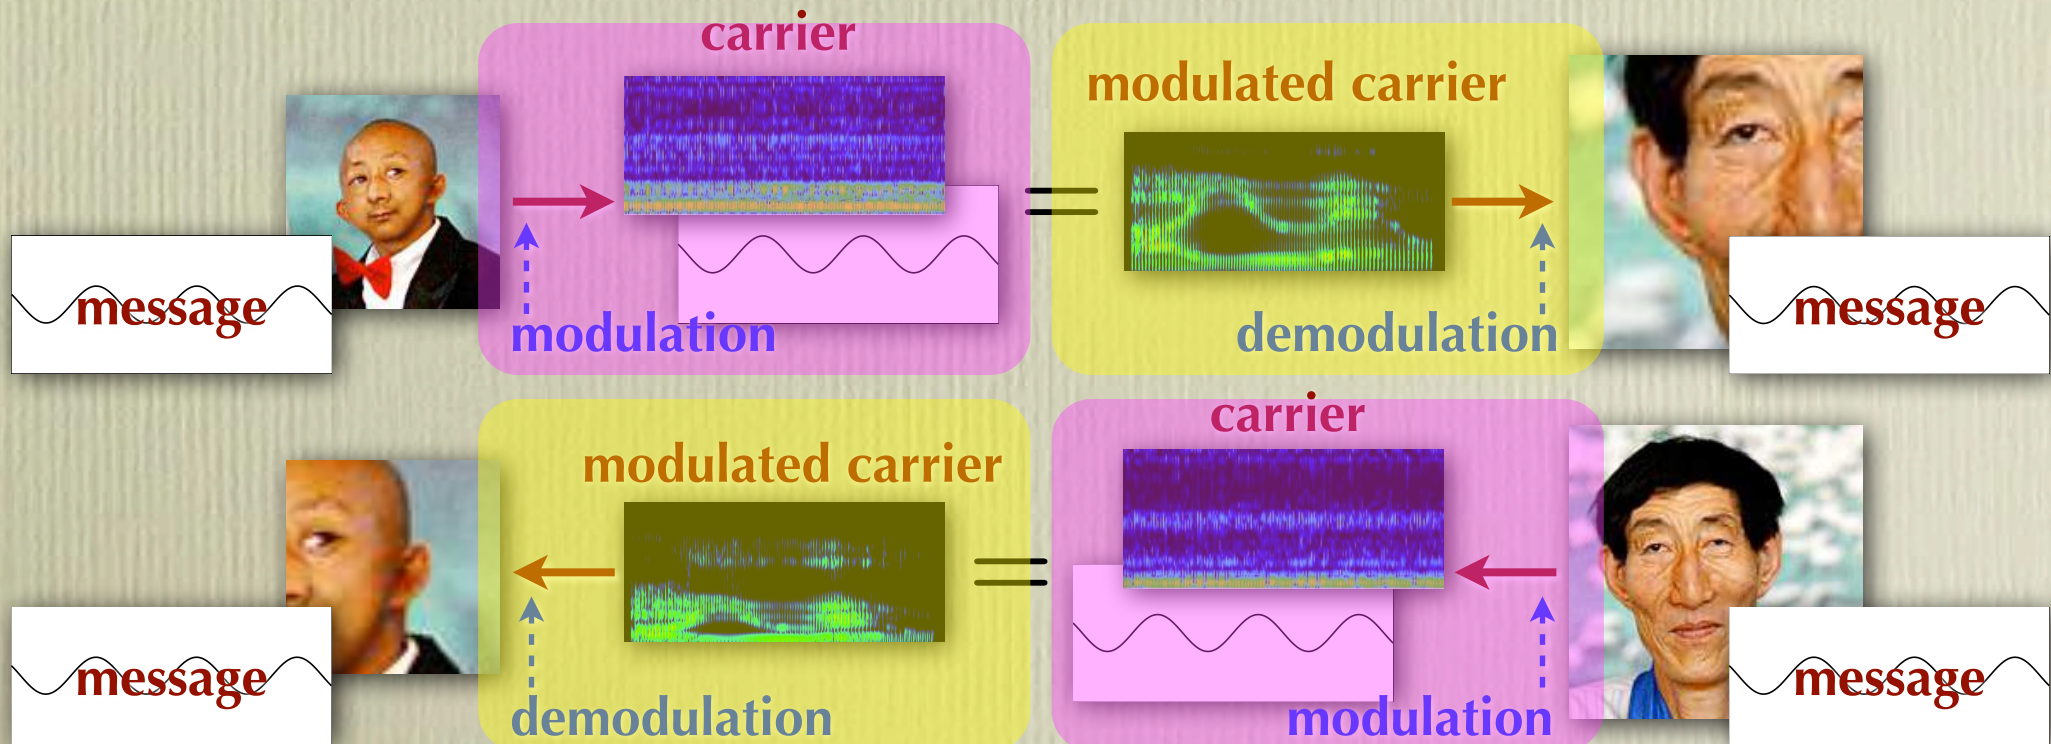

# Two questions

## Q1: Does the ape have a good modulator?

Does the tongue of the ape work as a good modulator?

## Q2: Does the ape have a good demodulator?

Does the ear (brain) of the ape extract the message intactly?

# The nature's solution for static bias?

How old is the invariant perception in evolution? [Hauser'03]

1

2

$$1 = 2$$

At least, frequency (pitch) demodulation seems difficult.

# Language acquisition through **vocal imitation**

## VI = children's active imitation of parents' utterances

- Language acquisition is based on vocal imitation [Jusczyk'00].
- VI is very rare in animals. No other primate does VI [Gruhn'06].
- Only small birds, whales, and dolphins do VI [Okanoya'08].

## A's VI = **acoustic imitation** but H's VI $\neq$ **acoustic** = ??

- Acoustic imitation performed by myna birds [Miyamoto'95]
  - They imitate the sounds of cars, doors, dogs, cats as well as human voices.
  - Hearing a very good myna bird say something, one can guess its owner.
- **Beyond-scale** imitation of utterances performed by children
  - No one can guess a parent by hearing the voices of his/her child.
  - Very **weird** imitation from a viewpoint of animal science [Okanoya'08].

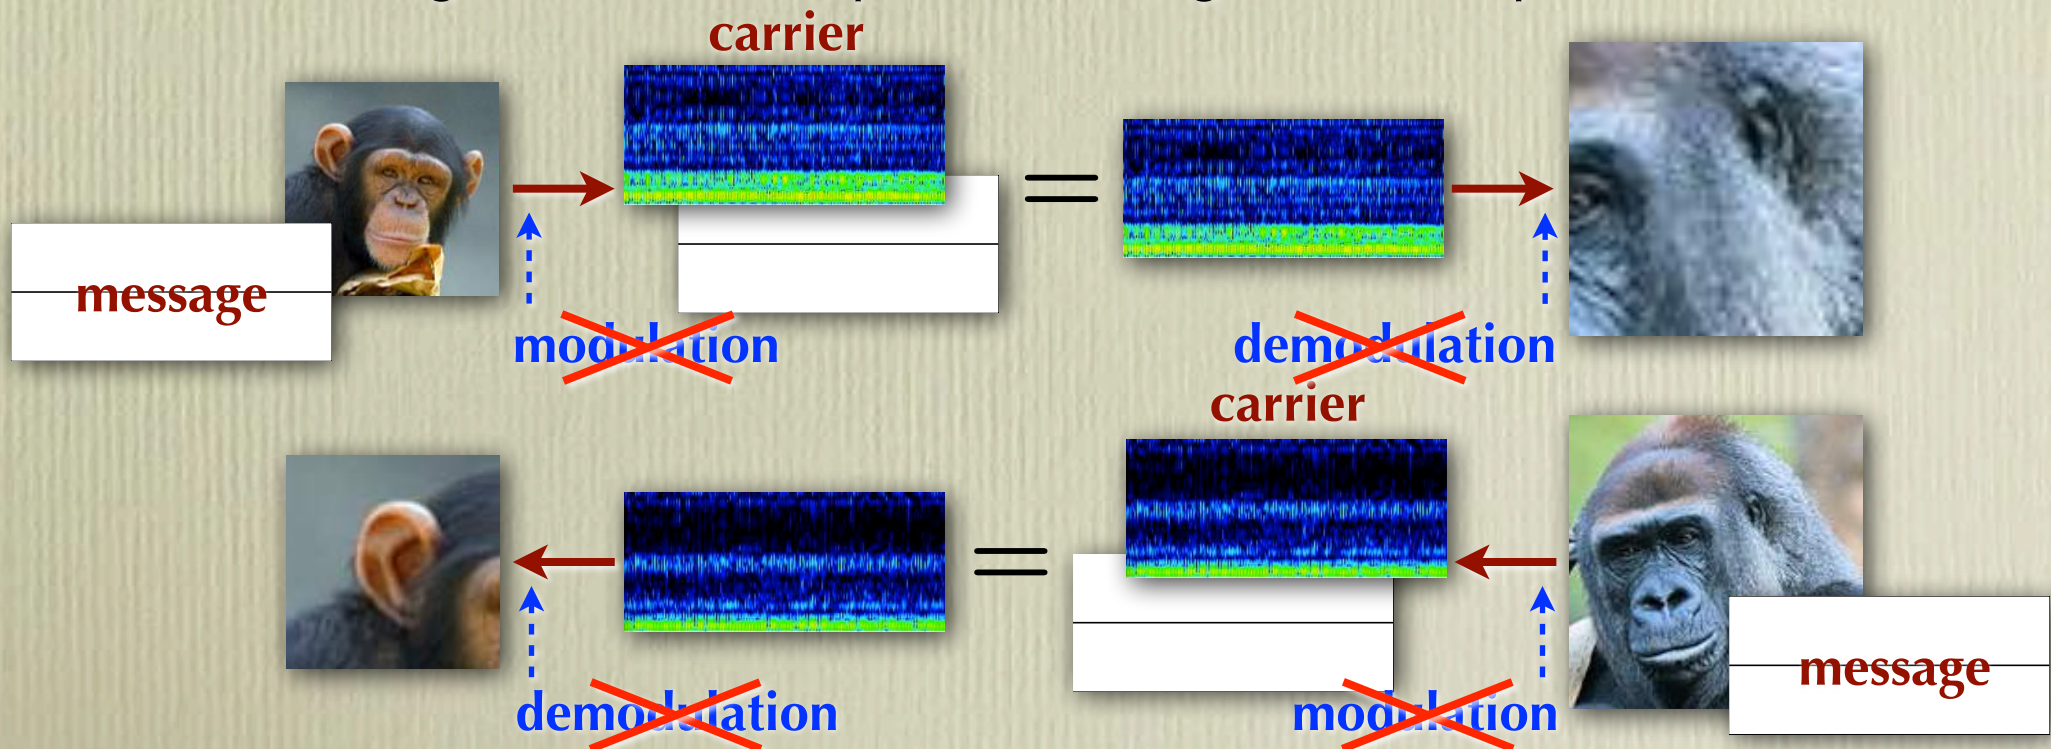

# Q2: Does the ape have a good demodulator?

## Cognitive difference bet. the ape and the human

- Humans can extract embedded messages in the modulated carrier.
- It seems that animals treat the (modulated) carrier as it is.

## From the (modulated) carrier, what can they know?

- The apes can identify individuals by hearing their voices.
  - Lower/higher formant frequencies = larger/smaller apes

# Function of the voice timbre

## What is the **original** function of the voice timbre?

### For apes

- The voice timbre is an acoustic correlate with the identity of apes.

### For speech scientists and engineers

- They had started research by correlating the voice timbre with messages conveyed by speech stream such as words and phonemes.
- Formant frequencies are treated as acoustic correlates with vowels.
- “Speech recognition” started first, then, “speaker recognition” followed.

$$f_n = \frac{c}{2l_1} n$$

$$f_n = \frac{c}{2l_2} n$$

$$f = \frac{c}{2\pi} \left[ \frac{A_2}{A_1 l_1 l_2} \right]^{1/2}$$

# Function of the voice timbre

## What is the original function of the voice timbre?

### For apes

- The voice timbre is an acoustic correlate with the identity of apes.

### For speech scientists and engineers

- They had started research by correlating the voice timbre with messages conveyed by speech stream such as words and phonemes.
  - Formant frequencies are treated as acoustic correlates with vowels.
- “Speech recognition” started first, then, “speaker recognition” followed.

## But the voice timbre can be changed easily.

### Speaker-independent acoustic model for word recognition

$$P(o|w) = \sum_s P(o, s|w) = \sum_s P(o|w, s)P(s|w) \sim \sum_s P(o|w, s)P(s)$$

### Speaker-adaptive acoustic model for word recognition

- HMMs are always modified and adapted to users.
- These methods don't remove speaker components in speech.

# Menu of the last four lectures

## **Robust processing of easily changeable stimuli**

- Robust processing of general sensory stimuli
- Any difference in the processing between humans and animals?

## **Human development of spoken language**

- Infants' vocal imitation of their parents' utterances
- What acoustic aspect of the parents' voices do they imitate?

## **Speaker-invariant holistic pattern in an utterance**

- Completely transform-invariant features --  $f$ -divergence --
- Implementation of word Gestalt as relative timbre perception
- Application of speech structure to robust speech processing

## **Radical but interesting discussion**
